Overview

What are molten salt batteries?

Molten-salt batteries, including sodium-nickel-chloride and sodium-sulfur batteries, are based on abundant raw materials. The former consist of a sodium-metal anode and a nickel-chloride cathode separated by a ceramic sodium-b''-alumina electrolyte and is commercialized by our industry partner FZSonick.

Are molten salt electrolytes a solution-to-solid conversion cathode in rechargeable aluminium batteries?

Conventional solid-to-solid conversion cathodes in rechargeable aluminium batteries suffer from sluggish reaction kinetics and cumulative structural degradation. Here the authors disclose a solution-to-solid conversion chemistry using molten salt electrolytes to achieve fast-charging capability and good cycling stability.

What are molten lithium metal batteries?

We recently invented new concept of molten lithium metal batteries, consisting of liquid lithium anodes, alloy (Sn, Bi, Pb) liquid cathodes and lithium ion conductor as solid electrolytes. Here we demonstrate a molten metal chloride battery that operates at a relatively low temperature of 210 °C.

What are molten sodium batteries (mnabs)?

Molten sodium batteries (MNaBs) may be among the most important technologies needed to meet the rapidly growing need for economical, reliable, grid-scale electrical energy storage.

Are molten sodium batteries safe?

Despite its promise as a safe, reliable system for grid-scale electrical energy storage, traditional molten sodium (Na) battery deployment remains limited by cost-inflating high-temperature operation.

Can molten salt cathode-solid electrolyte-molten lithium anode operate a high temperature battery?

In summary, we demonstrated a newly designed high temperature battery with molten salt cathode-solid electrolyte-molten lithium anode, which can be operated at a relative low temperature of 210 °C with good safety and low cost.

Allan Blanchard Inventions, Patents and Patent Applications

An energy storage device is provided comprising at least one liquid metal electrode, an energy storage capacity of at least about 1 MWh and a response time less than or equal to about 100 ...

MOLTEN SALT BATTERY WITH SOLID METAL CATHODE

The electrochemical energy storage device of claim 14, wherein said intermetallic material is included in a shell at least partially circumscribing a given solid particle of said plurality of solid ...

A high-voltage, low-temperature molten sodium battery enabled by metal

A molten salt catholyte and solid Na⁺ conducting separator enable cycling over 8 months, potentially promising a new generation of high-performance, low-temperature molten ...

A molten battery consisting of Li metal anode, AlCl₃

Herein, we designed a new high temperature battery chemistry with much higher theoretical specific energy and lower cost, which consists of

AlCl3-LiCl molten salt cathode, ...

Molten salt battery with solid metal cathode

In some embodiments, the intermetallic material is included in a shell at least partially circumscribing a given solid particle of the plurality of solid particles.
