## Overview

What are thermal storage technologies?

Thermal storage technologies have the potential to provide large capacity, long-duration storage to enable high penetrations of intermittent renewable energy, flexible energy generation for conventional baseload sources, and seasonal energy needs. Thermal storage options include sensible, latent, and thermochemical technologies.

What is a thermal energy storage system?

In these systems, the recovered heat is typically used to heat water that is stored in a hot water storage tank for domestic use. The use of a thermal energy storage (TES) system enables the recovered energy to meet future thermal demand.

Are performance and efficiency metrics important in thermal energy storage?

In the context of thermal energy storage, little attention is paid to quantifying SOC; instead, performance and efficiency metrics typically offer a steady-state or aggregate perspective of the behavior of the system (Han et al., 2009; Pizzolato et al., 2015).

What are the three types of thermal energy storage?

Three different thermal energy storage principles can be observed: sensible heat storage, latent heat storage, and thermochemical heat storage. These technologies store energy at a wide spectrum of temperatures, for different temporal ranges, and are able to meet a variety of energy system needs.

1. Sensible Energy Heat.
2. Latent Energy Storage

Why do we need dynamic performance metrics for thermal energy storage systems?

The use of a thermal energy storage (TES) system enables the recovered energy to meet future thermal demand. However, in order to design optimal

control strategies to achieve demand response, dynamic performance metrics for TES systems are needed.

How does thermochemical heat storage work?

Thermochemical heat storage (TCS) operates in two ways: chemical reactions and sorption processes. In the former, energy is stored as the heat of reaction of reversible reactions. The latter stores thermal energy either through adsorption (physical bonding) or absorption (uptake/dissolution of a material).
