A team of researchers has combined the best battery technologies to create the world's first anode-free sodium solid-state battery. The team's design uses a stable solid electrolyte and pressure to form dense sodium metal. An aluminum current collector ensures efficient, repeatable sodium plating.

Anode-less all-solid-state batteries (ALASSBs) represent a promising energy storage platform for various upcoming green mobility applications, as they offer superior energy density, manufacturing feasibility, and enhanced safety. However, their practical implementation is hindered by the formation.

Lithium Metal Batteries (LMBs) are among the best alternative technologies that would enable overcoming the performance limitations of current Li-ion Batteries (LIBs). However, LMBs also suffer from some drawbacks, including the use of Lithium metal anode (LMA), which raises safety, processing.
