## Overview

---

What is a storage phosphor screen?

A storage phosphor screen is a film-like sensor designed to trap and store radiation energy in a stable state. BAS Storage Phosphor Screens contain a photostimulable layer of phosphor particles (BaFBr) sandwiched between a protective layer and a support film coated with trace amounts of bivalent europium (Eu<sup>2+</sup>) as a luminescence center.

Can PSL phosphors absorb and store energy on-demand?

The distinctive capability of PSL materials to absorb, store, and release energy on-demand has sparked extensive research and application of these storage phosphors in various critical fields, such as dosimetry, computed radiography, and optical information storage 20, 21, 22.

What are photostimulable storage phosphor materials?

On the other hand, photostimulable storage phosphor materials, which can once store information of ionizing radiation, can be applied only for passive detectors, which are called “dosimeters”, such as thermally stimulated luminescence (TSL) dosimeters, optically stimulated luminescence (OSL) dosimeters, and radiophotoluminescence (RPL) dosimeters.

Are phosphorus-based mesoporous materials suitable for energy storage and conversion?

In this article, we highlight recent advancements in the synthesis of phosphorus-based mesoporous materials for energy storage and conversion, including metal phosphates, phosphonates, and phosphides. The discussion is sectioned into three parts according to different synthetic approaches (i.e., soft-template, hard-template, and template-free).

Which storage phosphor materials can be used for X-rays?

The BaFBr(I):Eu, RbBr:Eu, and CsBr:Eu(11) storage phosphor materials, which

exhibit high sensitivity for X-rays, have been applied as photostimulable storage phosphor material of the IP in computed radiography for medical diagnosis.

What phosphors are needed for optical data storage?

Furthermore, optical data storage application usually requires the storage phosphors to have a large trap depth (usually  $>1$  eV) and high trap density to ensure storage efficiency in dark environments and high PSL efficiency upon external light stimulation.
