Why are crude oil storage facilities built on the surface?

In practice, commercial operating storage facilities for crude oil are generally built on the surface primarily because the construction of tank farms is not dependent on the availability of suitable salt formations, and because the expense involved in planning, authorizing, and operating surface brine ponds is fairly considerable.

What are oil storage tanks?

Oil storage tanks are temporary storage where crude oil from various extraction sites is gathered. Sometimes these tanks are used in production and hold the oil until it is delivered to tankers or into a pipeline. Moreover, storage tanks are also used as a holding area for crude oil before refining.

What are the different types of crude oil storage tanks?

Crude oil is stored in various forms depending on location, capacity needs, and operational requirements: 1. Aboveground Storage Tanks (ASTs) • Types: Fixed roof tanks, floating roof tanks, and dome roof tanks. • Applications: Used for large-scale storage at refineries, terminals, and tank farms. • Advantages: Easy inspection and maintenance.
