

Chemical energy storage cannot replace pumped storage

Overview

Additionally, we include two well-established non-chemical long-term energy storage technologies, namely pumped hydroelectric storage (PHES) and compressed air energy storage (CAES), to compare their maturity and readiness with the stated chemical energy storage routes.

Additionally, we include two well-established non-chemical long-term energy storage technologies, namely pumped hydroelectric storage (PHES) and compressed air energy storage (CAES), to compare their maturity and readiness with the stated chemical energy storage routes.

Electrochemical: Storage of electricity in batteries or supercapacitors utilizing various materials for anode, cathode, electrode and electrolyte. Mechanical: Direct storage of potential or kinetic energy. Typically, pumped storage hydropower or compressed air energy storage (CAES) or flywheel.

As renewable energy surges (we're talking 35% of global electricity from wind and solar in 2024), two storage heavyweights are stealing the spotlight: chemical energy storage and pumped hydro. Let's unpack these technologies that keep Netflix streaming and factories humming when the sun clocks out.

This study reviews chemical and thermal energy storage technologies, focusing on how they integrate with renewable energy sources, industrial applications, and emerging challenges. Chemical Energy Storage systems, including hydrogen storage and power-to-fuel strategies, enable long-term energy.

Results From the current technical level, only pumped storage, chemical energy storage and hydrogen energy storage have the technical feasibility, economic marketization and prospect of scale. The energy storage measures that can be widely used are chemical battery energy storage and pumped.
