

Dual control energy storage

Overview

Can a dual-layer control strategy achieve fluctuation smoothing of wind power?

This paper proposes a dual-layer control strategy that can achieve fluctuation smoothing of the wind power, as shown in Fig. 3. In the first layer control, the parameter T of FLF is adaptively adjusted by the wind power fluctuation rate. It could dynamically optimize the power command for BESS.

Is a dual-layer cooperative control strategy for multiple Bess units a problem?

However, the BESS units may face the problem of over-charge/over-discharge if the power dispatch strategy for multiple units of BESS is improper, which results in lifetime degradation. In this paper, a dual-layer cooperative control strategy of multiple BESS units is proposed.

What are the different types of energy storage systems?

ESS mainly includes battery energy storage system (BESS), superconducting magnetic storage system (SMES), flywheels energy system (FES), and pumped storage system (PSS) [14,15].

Can dual-battery ESS control avoid discharge depth and frequent charge/discharge?

A dual-battery ESS control strategy that can avoid the discharge depth and frequent charge/discharge is proposed in . However, the above strategies ignore the variation of BESS output demand due to the time-varying characteristics of wind power, especially during short-term strong power fluctuations.

How does a dual-layer control work?

The dual-layer control works cooperatively to avoid over-charge/over-discharge, which helps extend the lifetime of BESS. In order to compare the accuracy and effectiveness of different control strategies, the energy-

optimized rate index, the cycle lifetime index and the SOC discretization index are proposed respectively.

Can a battery storage energy system smooth wind power fluctuation?

Installation of the battery storage energy system (BESS) in a wind farm (WF) can effectively smooth wind power fluctuation. However, the BESS units may face the problem of over-charge/over-discharge if the power dispatch strategy for multiple units of BESS is improper, which results in lifetime degradation.
