

# **Energy storage and charging of agricultural machinery**

## Overview

---

In this article, a new model capable of simulating electric non-road heavy machinery systems with a local grid-connected energy management system and two on-field energy replenishment modes: on-field battery exchange and charging, is presented.

From electric tractors to automated harvesters, farms across the globe are increasingly turning to cleaner, smarter machinery. According to the International Energy Agency's Electricity 2025 report, global electricity demand continues to rise—driven not only by transport but also by shifts in.

This study systematically reviews the latest advancements in electrification and smartification technologies for modern tractors, with a particular focus on algorithmic control strategies and their applications. Architecturally, the study provides a comparative analysis of four key configurations.

Energy storage plays a pivotal role in the electrification of tractors and farm equipment by providing necessary advantages such as 1. enhanced efficiency, 2. reduced environmental impact, 3. consistency in power supply, and 4. economic savings. The transition to electric-powered agricultural.

Agricultural tractors with electric propulsion systems are a viable alternative capable of bringing significant improvements to agriculture and contributing to sustainability. Such electric propulsion systems basically consist of electric motors, power electronic converters, and electronic control.

Self-generated electricity can be provided for charging farm e-vehicles or agricultural machinery. An intelligent battery storage system is the solution to your daily challenges: It stores solar power that can be used to reduce peak loads when needed and is ideal for industrial and commercial use. Do electric tractors have energy management strategies and powertrains?

A guide for research on energy management strategies and powertrains of electric tractors is provided. Given the increasing demand for sustainable agricultural practices and energy conservation, advanced technologies for electric agricultural machinery (EAM) are critically needed.

How to charge electric tractors?

Charging methods of electric tractors The battery pack is the prime source of energy in an electric tractor and can be charged using different methods. Conductive charging technique is one of the available methods of charging, which can further differentiate into AC and DC charging.

What percentage of agricultural machinery is electrified?

It ranges from 42 % to 72 %. The reference paper provides a comprehensive review of the electrification of agricultural machinery, particularly focusing on the technologies, challenges, and potential benefits of moving towards the electric-powered equipment.

Can solar power be used to charge electric tractors?

To ensure the sustainability of electric tractors, this paper explores the use of renewable energy sources (RES), such as solar and wind, for battery charging. Among these, solar energy is identified as the most practical and efficient option.

Is electrification a roadmap for sustainable agricultural practices?

By reviewing various powertrains, charging methods, and future technologies, this study provides a roadmap for advancing sustainable agricultural practices through electrification.

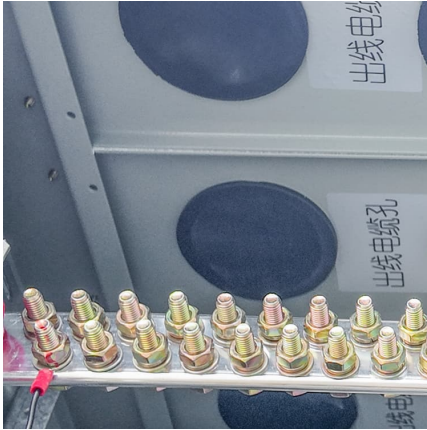

How to make electric tractors sustainable?

To make electric tractors sustainable and to have continuous farming operation, charging the battery using renewable energy sources like solar and wind is discussed. Recommendations are provided for transmitting the energy to the tractor, operating with continuous duty of more than eight hours during the field operation.
