## Overview

---

What is maintenance and fault diagnosis technology of new energy vehicles?

In order to ensure the normal and practical use of new energy vehicles, it is necessary to analyze their faults in time in daily use and adopt effective maintenance technology to repair them. The maintenance and fault diagnosis technology of new energy vehicles is related to the stable operation and service life of vehicles.

Why do EVs need a fault diagnosis system?

EVs are becoming an increasingly integrated component of transportation in order to fulfill ever-increasing demands for improved performance with safety and reduced environmental impact. Therefore, to increase the efficiency and reduce the maintenance cost of these vehicles, an early fault diagnosis (FD) system is essential.

How to diagnose battery system fault in real-vehicle operation conditions?

In battery system fault diagnosis, finding a suitable extraction method of fault feature parameters is the basis for battery system fault diagnosis in real-vehicle operation conditions. At present, model-based fault diagnosis methods are still the hot spot of research.

How to improve the effect of fault diagnosis and maintenance?

In order to improve the effect of fault diagnosis and maintenance, sensors should be used together and fully applied to ensure the fault and maintenance results, so as to understand the running state of the vehicle, avoid the increase of fault probability and improve the service efficiency and quality of new energy vehicles. 4. Conclusions.

How to detect a fault in a new energy vehicle?

Sensory method needs to be observed by the maintenance personnel to judge whether there is smoke, sparks, abnormal sound and other phenomena in the

circuit of new energy vehicles, and then combine the experience, specific situation and system principle of the staff to judge the fault point, infer the fault factors and eliminate the fault content.

Can big data be used in EV fault diagnosis?

Big data application: The application of big data in real-world electric vehicle (EV) fault diagnosis is detailed. An exhaustive analysis of current methodologies and a discussion of future development directions are presented, providing practical guidance for implementing real-time monitoring and risk pre-warning systems.
