

Environmental assessment requirements for independent energy storage projects

Overview

Do different energy storage methods have different environmental and economic impacts?

However, different energy storage methods have different environmental and economic impacts in renewable energy systems. This paper proposed three different energy storage methods for hybrid energy systems containing different renewable energy including wind, solar, bioenergy and hydropower, meanwhile.

Do energy storage environmental benefits outweigh environmental impacts?

Differences in the rate at which energy storage environmental benefits and impacts scale as more energy storage is deployed indicate the potential for a capacity level where the environmental impacts of these systems outweigh their benefits.

Do energy storage thresholds exist?

Determining whether these thresholds exist and at what capacity level these thresholds occur for different types of environmental impacts is critical for better understanding the role of energy storage in facilitating more sustainable energy infrastructure development and for ensuring that its deployment provides a net environmental benefit.

How is the environmental impact of battery energy storage calculated?

The environmental impact of battery energy storage was calculated by using Simapro, taking into account the use-phase and manufacturing impacts. However, the transportation of raw materials to the manufacturing plant was not taken into account. The end-of-life phase is not included in this report.

Who are the intended audiences of California's Energy Storage Project?

There were three intended audiences of the project. The first audience is state agency staff at the CEC and the California Public Utilities Commission (CPUC)

who are involved in policy decisions regarding long-duration energy storage deployment to support California's electricity decarbonization goals.

What is the purpose of energy storage engagements?

The purpose of these engagements was to inform staff involved in assessing plans for the deployment of energy storage technologies to support California's electricity decarbonization goals, specifically to provide information on flow batteries which may be used for long-duration storage functions.
