Overview

How does a hydraulic accumulator work?

The accumulators use nitrogen to keep the hydraulic fluid pressurized. When the fluid is pumped into an accumulator the nitrogen (N₂) inside the accumulator is compressed. When all the hydraulic fluid is in an accumulator designed for high pressure side of an HHV, the pressure of the nitrogen reaches 5000 pounds per square inch (psi).

What type of accumulator does EPA use?

EPA has used two types of accumulators in their hydraulic hybrids: [Download Video: MP4 \(13 seconds, 1,256kb\)](#), [WebM \(13 seconds, 678kb\)](#), [Ogg \(13 seconds, 1,024kb\)](#) In this type of accumulator hydraulic fluid compresses a nitrogen-filled bladder to create pressure.

Can hydraulic accumulators be used for energy storage?

Fluids are practically incompressible and can therefore not be directly used for energy storage. Hydraulic accumulators make storing fluids under pressure possible. Their operating principle is based on the Boyle-Mariotte's law ($P \times V = \text{constant}$) and the compressibility difference between fluids and gases.

What is the pressure of nitrogen in a hydraulic accumulator?

When the fluid is pumped into an accumulator the nitrogen (N₂) inside the accumulator is compressed. When all the hydraulic fluid is in an accumulator designed for high pressure side of an HHV, the pressure of the nitrogen reaches 5000 pounds per square inch (psi). If empty of fluid, the pressure of the nitrogen is about 2000 psi.

What is the operating principle of a hydraulic system?

Their operating principle is based on the Boyle-Mariotte's law ($P \times V = \text{constant}$) and the compressibility difference between fluids and gases. Storage and, as required, release of the energy transmitted by the fluid.

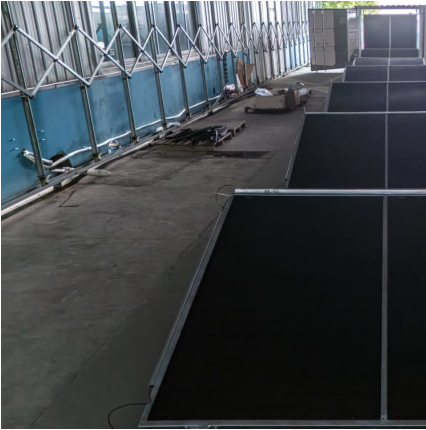

Maintaining a required level of pressure for a certain period of time. Hydraulic compensations of big masses.

What is the operating pressure of the accumulator?

Operating pressure p max. min. Operating temperature T max. The data sheets allow one to select the desired accumulator in the requested pressure range with the capacity of $V > 7,3$ l. 10 - 210 - L will do the job (according to the desired accumulator shape). Our computer calculation gives a ΔV of 2,06 l at 25 °C and 2,26 l at 45 °C.
