## Overview

---

SAN DIEGO – An 11,000 pound metal flywheel caused an explosion this summer that injured four people at the warehouse of a Poway technology firm, state officials said this week. The blast occurred June 10 at Quantum Energy Storage at 13350 Gregg St. Are energy storage flywheels dangerous?

Even though there are hardly any known accidents involving energy storage flywheels that actually resulted in personal injury, incidents such as the much-cited rotor burst in Beacon Power's grid stability plant in Stephentown are sufficient to fuel mistrust of FESS technology [ 1 ].

Is a flywheel energy storage system a burst containment?

The housing of a flywheel energy storage system (FESS) also serves as a burst containment in the case of rotor failure or vehicle crash. In this chapter, the requirements for this safety-critical component are discussed, followed by an analysis of historical and contemporary burst containment designs.

What is a flywheel energy storage system (fess)?

Flywheel Energy Storage Systems (FESS) play an important role in the energy storage business. Its ability to cycle and deliver high power, as well as, high power gradients makes them superior for storage applications such as frequency regulation, voltage support and power firming.

Are stornetic flywheels safe if a rotor burst?

In addition to the Sandia guidelines (4), Stornetic also believes that flywheels up to a certain energy content can be contained and mounted safely even in the event of a severe rotor burst. These designs offer additional safety opportunities to those of the Sandia recommendations.

What is the energy content of a flywheel?

The energy content of a 1.5 kWh flywheel is therefore equivalent to the kinetic energy of a car traveling at over 300 km/h. The greatest danger is the

breakage of the rotor and the high energy of the fragments due to the extreme rim speeds.

What makes a safe flywheel system?

Robust system design, in combination with the use of certified critical materials, relevant quality control measures and documentation, are the basis for the construction of safe flywheel systems. These can be certified by appropriate independent parties as in the manufacture of many other products.
