

# High energy storage amino acids

## Overview

---

In this work, we explore the concepts of molecular dynamics (MD) to investigate the energy storage capacity of supercapacitors (SCs) composed of amino acid-based ionic liquids (AAILs) as pure and hydrated electrolytes, and graphene electrodes.

Aqueous organic redox flow batteries offer promising prospects for large-scale, high-safety, and cost-effective energy storage systems with no reliance on scarce mineral resources.

As one of the most intensively investigated biomaterials, proteins have recently been applied in various high-performance rechargeable batteries. In this review, the opportunities and challenges of using protein-based materials for high-performance energy storage devices are discussed.

Amino acid protic ionic liquids (AA-PILs) rich in C, N, O, and S elements can be easily synthesized, making them a promising potential precursor of N/S codoped carbon materials for high-performance supercapacitors.

In this study, we successfully improved both the capacity and cycling stability by simply grafting amino acids onto organic compounds (PMCDI). Firstly, the introduction of amino acids facilitated the formation of a more stable layered structure of PMCDI through hydrogen bonding.
