Overview

What are alternative energy storage solutions for residential applications?

While this study primarily evaluates Lead-Acid and Li-ion batteries, other energy storage technologies, such as flow batteries, thermal energy storage, and hydrogen-based systems, may offer alternative solutions for residential applications.

Should energy storage systems be model studies?

They should be treated as model studies that can be replicated by the user for their own purposes. Additionally, they are a clear cross-section of highly relevant, contemporary use cases for energy storage systems that exemplify how valuable the flexibility they offer can be.

Can energy storage equipment improve the economic and environment of residential energy systems?

It is concluded that this kind of energy storage equipment can enhance the economics and environment of residential energy systems. The thermal energy storage system (TESS) has the shortest payback period (7.84 years), and the CO₂ emissions are the lowest.

Can energy storage devices complement the hems residential energy management strategy?

In this study, to complement the HEMS residential energy management strategy, we introduce storage devices based on existing target home energy systems. Adding energy storage devices can improve the performance of the PVs and thermal electric pumps in the system, stabilize the system, enhance user economics, and balance grid loads.

Which research model is used to optimize energy storage device configuration?

Table 2 Case introduction. This study involved two main research models,

namely, the double-layer optimization model and the comprehensive comparison model. The double-layer optimization model is used to achieve dual optimization of the energy storage device configuration and system energy management.

Can a composite energy system be used for residential energy storage?

Currently, the application and optimization of residential energy storage have focused mostly on batteries, with little consideration given to other forms of energy storage. Based on the load characteristics of users, this paper proposes a composite energy system that applies solar, electric, thermal and other types of energy.
