Overview

What is the energy storage system test manual?

INTRODUCTION 1.1 Purpose The following Energy Storage System Test Manual is a series of detailed procedures developed by EPRI in concert with the Testing and Characterization Working Group of the Energy Storage Integration Council (ESIC). This manual addresses the performance and functional testing of energy storage systems (ESSs).

What is the basic testing and characterization of energy storage systems?

The Basic Testing and Characterization of Energy Storage Systems is intended to be storage- technology agnostic, encompassing all electricity -in, electricity -out energy storage technologies.

What is the performance and functional testing of energy storage systems?

This manual addresses the performance and functional testing of energy storage systems (ESSs). The objective is to provide specific, detailed test procedures that are reproducible so that utilities and other testing entities can easily use them for the performance evaluation of energy storage systems . The key principles that guide this effort:.

Can a residential energy storage system be ul 9540a certified?

No. In order to achieve a UL 9540 certification or listing, a residential energy storage system must meet the unit level performance criteria of UL 9540A when the spacing between individual battery energy storage systems is less than 3 ft (0.9 m) in accordance with the installation codes (NFPA 855, IRC).

Which energy storage system parameters should be measured with a power meter?

Most of the following energy storage system parameters are to be measured with appropriate power meters having the specified accuracy and a minimum data sampling rate capability of at least 128 samples per 60 Hz cycle:

Voltage, Current, Power Factor, Power, and Energy.

How should a storage system be tested?

Testing should ensure that the system is capable of complete electrical isolation of the storage system coupled with a local load, with no ability to charge or discharge to and from the grid. This may involve manual and automated islanding functions (see IEEE 1547 also).
