Power Control Systems (PCS), as defined in NFPA 70, National Electrical Code 2020 Edition, control the output of one or more power production sources, energy storage systems (ESS), and other equipment. PCS systems limit current and loading on the busbars and conductors supplied by the power.

Let's face it - configuring energy storage systems isn't exactly coffee machine programming. This guide speaks directly to: The global energy storage market is booming at \$33 billion annually [1], but here's the kicker - 68% of first-time installers report configuration hiccups. Let's change that.

A Power Conversion System (PCS) is a critical component in a Battery Energy Storage System (BESS). Its main role is to convert electrical power from one form to another, typically from Direct Current (DC) to Alternating Current (AC) and vice versa. This allows for the integration of battery storage.
