

# **LFP battery system cost vs benefit calculation in Mauritius**

## Overview

---

Do Chinese LFP cell manufacturers profit from NMC vs EU LFP?

As stated, Chinese LFP cell manufacturers especially profit from: Overall there is a up to 19% cost increase for NMC over LFP including the CN vs. EU localization effects on a pure reference cost comparison (excl. pricing and subsidy effects) and this ratio is maintained from materials to total cell product cost.

What is the difference between LFP and NCM?

But for LFP the cathode can be up to 25% of the total costs. But for NCM, cathodes can be up to 40% of the total cost. LFP cost structure can better take advantage of economies of scale compared to NCM. The main cost contributors to a lithium ion battery cell are the cathode, the anode, the separator, and the electrolyte.

Why is battery energy storage system being introduced in Mauritius?

The CEB is introducing a Battery Energy Storage System (BESS) on its network to arrest the fluctuation inherent to Variable Renewable Energy (VRE) systems. This is due to the increasing share of VRE in Mauritius' energy mix, as the country's energy transition to a low carbon economy gains momentum.

What factors influence Bess prices battery technology?

Key Factors Influencing BESS Prices Battery Technology: Lithium-ion batteries dominate the market, particularly Lithium Iron Phosphate (LFP) and Nickel Manganese Cobalt (NMC) chemistries. LFP has become more popular than the other due to its lower cost and longer lifespan.

Do battery storage technologies use financial assumptions?

The battery storage technologies do not calculate levelized cost of energy (LCOE) or levelized cost of storage (LCOS) and so do not use financial assumptions. Therefore, all parameters are the same for the research and

development (R&D) and Markets & Policies Financials cases.

What is LFP cost structure?

As you can see by the graph, LFP cost structure can also better take advantage of economies of scale. The main cost contributors to a lithium ion battery cell are the cathode, the anode, the separator, and the electrolyte. For LFP, these four main contributors mainly make up about 50% of the total cost.
