

Large-scale energy storage power station design specifications

Overview

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

What is the market for grid-scale battery storage?

The current market for grid-scale battery storage in the United States and globally is dominated by lithium-ion chemistries (Figure 1).

What is the difference between rated power capacity and storage duration?

Rated power capacity is the total possible instantaneous discharge capability (in kilowatts [kW] or megawatts [MW]) of the BESS, or the maximum rate of discharge that the BESS can achieve, starting from a fully charged state. Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity.

What is power capacity value?

Capacity Value (\$): The monetary value of the contribution of a generator (conventional, renewable, or storage) to balancing supply and demand when generation is scarce. Operating Reserves and Ancillary Services: To maintain reliable power system operations, generation must exactly match electricity demand at all times.

How much power can a Bess generate?

The BESS can bid 30 MW and 119 MWh of its capacity directly into the market for energy arbitrage, while the rest is withheld for maintaining grid frequency during unexpected outages until other, slower generators can be brought online (AEMO 2018).

How much energy can a Megapack store?

Each unit can store over 3.9 MWh of energy—that's enough energy to power an average of 3,600 homes for one hour. Each Megapack unit ships fully assembled and ready to operate, allowing for quick installation timelines and reduced complexity.
