## Overview

---

How much do NMC batteries cost?

For NMC batteries, the highest life cycle benefit is \$66.67/kWh battery, which is achieved through direct recycling after CBS use from 90% to 40% SOH. The least profitable is the -\$59.26/kWh battery using direct recycling of LSV-used batteries with 90% to 40% SOH.

What are the applications of battery recycling?

Applications in the reuse phase include energy storage systems (ESSs), communication base stations (CBSs), and low-speed vehicles (LSVs). When the batteries are subjected to the EOL stage, pretreatment and three recycling technologies are considered, including hydrometallurgical, direct, and pyrometallurgical recycling.

How does 80% SoH affect NMC batteries?

NMC batteries with an 80% SOH result in a profit of \$38/kWh battery and a decrease of 0.14 kg CO<sub>2</sub>-eq/kWh for life cycle electricity delivery for CBS reuse and direct recycling.

What is the framework for battery recycling?

The framework includes a battery position and shape measurement system based on machine vision, an automatic battery removal system based on UR5 industrial robot, a battery residual energy detection, and classification system. Furthermore, a real case study of battery pack recycling was carried out based on manual work and automatic robot work.

Are NMC batteries good for the environment?

NMC batteries offer significant environmental benefits when recycled, especially due to the carbon footprint of the positive electrode material, while the carbon footprint benefit of recycling LFP batteries is relatively low.

Can battery research help create a more circular and cost-effective energy storage industry?

New research in this area could prove invaluable in creating a more circular and cost-effective energy storage industry. As battery research and the battery industry continue to evolve and grow, battery recycling research and industry must also change and expand.
