Covalent organic frameworks (COFs) are a class of porous crystalline materials based on reticular and dynamic covalent chemistry. Flexible molecular design strategies, tunable porosity, modifiable frameworks, and atomically precise structures have made them powerful platforms for developing.

This study grafted a bulky azobenzene derivative, 4'-aminoazobenzene-4-sulfonic acid (AABS), onto the surface of ZIF-90, thereby preparing a metal-organic framework material, ZIF-90-AABS (ZIF-AABS), with photothermal conversion effects. The template-like effect on the surface of ZIF-AABS enables.

Metal organic Framework is a family of 2D transition-metal carbides and nitrides, and has emerged as promising materials for a wide range of applications, particularly in electro- and photocatalytic water splitting for hydrogen generation. Their unique structure, large surface area, metallic. What is a covalent organic framework?
