

Photothermal energy storage life

Overview

What is photothermal phase change energy storage?

To meet the demands of the global energy transition, photothermal phase change energy storage materials have emerged as an innovative solution. These materials, utilizing various photothermal conversion carriers, can passively store energy and respond to changes in light exposure, thereby enhancing the efficiency of energy systems.

Can photochemical energy and photothermal energy be stored together?

For the solar-chemical-thermal fuel application, the solar spectra should be rationally split for simultaneous storage of the photochemical energy and photothermal energy. The emerging photoswitchable PCMs could attract interdisciplinary efforts from chemistry, material science, and energy engineering.

What is thermal energy storage based on phase change materials?

Thermal energy storage based on phase change materials (PCMs) is of particular interest in many applications, such as the heating and cooling of buildings, battery and electronic thermal management, and thermal textiles.

What is the photothermal conversion and storage efficiency of ODA@MOF/PPy-6%?

Importantly, the photothermal conversion and storage efficiency of ODA@MOF/PPy-6% is up to 88.3%. Additionally, our developed MOF-based photothermal composite PCMs also exhibit long-standing antileakage stability, energy storage stability, and photothermal conversion stability.

Are MOF-based photothermal composite PCMs suitable for solar energy utilization?

Additionally, MOF-based photothermal composite PCMs also exhibit excellent thermal energy storage stability and photothermal conversion stability,

showing great application prospects in solar energy utilization.

Conceptualization: Xiao Chen. Investigation and data curation: Panpan Liu, Mengke Huang, Yan Gao, Yang Li, Cheng Dong, and Xiao Chen.

What is PCM based photothermal conversion and storage system?

The PCM-based photothermal conversion and storage system is composed of photothermal conversion unit (PPy), latent heat storage unit (ODA), and supporting framework (MOF). High content (6%) of PPy is more conducive to the improvement of these thermophysical properties of ODA@MOF/PPy composite PCMs.
