

Photothermal energy storage power generation technology

Overview

What is photothermal power technology?

Photothermal power technology is a typical photo-thermal-electric conversion system based on the photothermal effect and Seebeck effect , . In this system, photothermal materials convert the absorbed solar energy into heat energy, and then convert it into electricity through the thermoelectric generator , , .

What are photothermal conversions of solar energy?

Then, the state-of-the-art progress for photothermal conversions of solar energy is introduced in detail, mainly including photothermal water evaporation and desalination, photothermal catalysis, photothermal electric power generation, photothermal bacterial killing, photothermal sensors, and photothermal deicing.

What is photothermal phase change energy storage?

To meet the demands of the global energy transition, photothermal phase change energy storage materials have emerged as an innovative solution. These materials, utilizing various photothermal conversion carriers, can passively store energy and respond to changes in light exposure, thereby enhancing the efficiency of energy systems.

How efficient is photothermal power generation?

Although photothermal electric power generation can show a solar-to-electricity conversion efficiency exceeding 7% under 38 Sun, its conversion efficiency remains very low under low concentration solar intensity, such as 1 Sun or ambient conditions.

What are the applications of photothermal technology?

As one of the fastest growing renewable energy sources, photothermal technology has a wide range of application scenarios in various fields, including the supply of hot water , heating systems , industrial production ,

seawater desalination , air conditioning and refrigeration technologies , and power generation , , .

Is photo-thermoelectric power a promising solar energy conversion technology?

To conclude, photo-thermoelectric power is a promising solar energy conversion technology, but many efforts should be made to improve the solar-to-electricity efficiency, because the efficiency remains still very low based on photo-thermoelectric conversion under AM 1.5 G illumination.
