associated with solar PV system installation and maintenance. “General Practice” refers to general requirements in fulfilling statutory requirements and guidelines as well as aligning common practices in the trade. Whilst “Best Practice” helps to further enhance the safety and system performance.

This Solar + Storage Design & Installation Requirements document details the requirements and minimum criteria for a solar electric (“photovoltaic” or “PV”) system (“System”), or Battery Energy Storage System (“battery” or “BESS”) installed by a Solar Program trade ally under Energy Trust's Solar.

stand-alone PV systems where PV is the only charging source. This document details the minimum size requirement for a solar energy system. Some allow systems rated at 10 MW and higher, some at 1 MW. Energy storage or PV would provide significantly faster response times than conventional generation.

Requirements and specifications for the construction of photovoltaic systems. Some allow systems rated at 10 MW and higher, some at 1 MW. Energy storage or PV would provide significantly faster response times than conventional generation. Systems could respond in milliseconds. Can fixed energy storage capacity be configured based on uncertainty of PV power generation?

As PV power outputs have strong random fluctuations and uncertainty, it is

difficult to satisfy the grid-connection requirements using fixed energy storage capacity configuration methods. In this paper, a method of configuring energy storage capacity is proposed based on the uncertainty of PV power generation.

What are the requirements for large PV power plants?

Large PV power plants (i.e., greater than 20 MW at the utility interconnection) that provide power into the bulk power system must comply with standards related to reliability and adequacy promulgated by authorities such as NERC and the Federal Energy Regulatory Commission (FERC).

Why is it important to compensate for photovoltaic (PV) power forecast errors?

Compensating for photovoltaic (PV) power forecast errors is an important function of energy storage systems. As PV power outputs have strong random fluctuations and uncertainty, it is difficult to satisfy the grid-connection requirements using fixed energy storage capacity configuration methods.

What is a configured energy storage system?

The configured energy storage system compensates for power differences and tracks the target output of the PV system. The required energy storage system capacity depends on the forecast error; the same configuration for all conditions is likely to increase energy storage system operating costs.

How do energy storage systems compensate for PV power forecast errors?

Compensating for PV power forecast errors is an important function of energy storage systems [16, 17]. The capacity of an energy storage system is calculated based on the PV power forecast; an energy storage device is used to compensate for the power forecast error, effectively reducing the loss caused by the PV power forecast error.

Which inverter is required for a combined PV and storage system?

Combined PV and storage system topologies will generally require a bi-directional inverter, either as the primary inverter solution (DC-coupled) or in addition to the unidirectional PV inverters (AC-coupled).
