

Professional configuration requirements for energy storage power station design

Overview

What is the optimal configuration for energy storage?

The optimal configuration for power and maximum continuous energy storage duration is determined to be 30.99 MW and 4.52 h, respectively. At this configuration, the average daily return is 2.362×10^5 yuan and the initial investment cost is 1.45×10^9 yuan. Fig. 20. Optimal solution selected by TOPSIS. Table 4. Optimal solution data.

How much storage capacity should a new energy project have?

For instance, in Guangdong Province, new energy projects must configure energy storage with a capacity of at least 10% of the installed capacity, with a storage duration of 1 h. However, the selection of the appropriate storage capacity and commercial model is closely tied to the actual benefits of renewable energy power plants.

What are energy storage configuration models?

Energy storage configuration models were developed for different modes, including self-built, leased, and shared options. Each mode has its own tailored energy storage configuration strategy, providing theoretical support for energy storage planning in various commercial contexts.

What are the different types of energy storage configurations?

New energy power plants can implement energy storage configurations through commercial modes such as self-built, leased, and shared. In these three modes, the entities involved can be classified into two categories: the actual owner of the energy storage and the user of the energy storage.

Why is energy storage configuration important?

In the context of increasing renewable energy penetration, energy storage configuration plays a critical role in mitigating output volatility, enhancing absorption rates, and ensuring the stable operation of power systems.

What is the optimal capacity optimization model for energy storage system?

Subsequently, based on the optimal strategy for joint operation, with the maximization of economic benefits for energy storage system as the objective, a capacity optimization model is established. The NSGA-II algorithm is employed to determine the optimal capacity of the BESS, thereby achieving revenue maximization.
