With NREL's cost model for pumped storage hydropower technologies, researchers and developers can calculate cost and performance for specific development sites. Photo by Consumers Energy. Pumped storage hydropower (PSH) plants can store large quantities of energy equivalent to 8 or more hours of.

The goal of this project is to design a cost-effective, small-scale adjustable speed pumped storage hydro (AS-PSH) system optimized for the U.S. energy storage requirements. The technology is proven through concept design for exemplar sites including estimated costs. The project demonstrates that.

The National Renewable Energy Laboratory has released an open-source pumped storage hydropower cost model tool that estimates how much new PSH projects might cost based on specific site specifications like geography, terrain, construction materials, and more. The tool integrates data from users --.

We have teamed up with experienced engineers to produce a cost model that, given some basic information for a possible pumped hydro site, will produce a reasonable cost estimate. This will be released soon. To view a webinar detailing the upcoming PHES cost model, download the following powerpoint.

for high capacity, long duration energy storage. PSH can support large penetration of VRE, such as wind and solar, into the power system by compensating for their variability and provides a range of grid services such as mechanical inertia, frequency regulation and voltage control, operating.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at NREL 46526. NREL prints on paper that contains recycled content. This report, originally published in September 2023, has been revised in March 2024 to improve and correct.
