

Research and design of enterprise shared energy storage policy

Overview

The results show that the development of a shared energy storage policy should (1) comprehensively consider the new energy and energy storage planning objectives, system flexibility requirements, and other factors, (2) actively expand energy storage revenue sources, and (3) reasonably allocate energy storage costs to the source, grid, and load to realize the high-quality coordinated development of new energy and energy storage. How do we integrate storage sharing into the design phase of energy systems?

We adopt a cooperative game approach to incorporate storage sharing into the design phase of energy systems. To ensure a fair distribution of cooperative benefits, we introduce a benefit allocation mechanism based on contributions to energy storage sharing.

What are the operational intricacies of shared energy storage systems?

The operational intricacies of shared energy storage systems have garnered substantial scholarly interest within the domain of energy storage sharing. Researchers typically approach the management of these systems by formulating it as an optimization problem, which is generally categorized as either single-level or bi-level in nature [11, 12].

What is shared electrical energy storage (SES) & shared thermal energy storage?

To mend the research gap, two CHP-SES system modes and design procedures, namely shared electrical energy storage (SEES), and shared thermal energy storage (STES), are proposed. These systems store distributed green power curtailments during the charging process and convert them to available power or heat during the discharging process.

Why is shared energy storage system important?

Shared energy storage system ensures the economic feasibility of all participants. With the rapid development of distributed renewable energy, energy storage system plays an increasingly prominent role in ensuring

efficient operation of power system in local communities.

Does shared energy storage sharing provide a fair distribution of benefits?

To ensure a fair distribution of cooperative benefits, we introduce a benefit allocation mechanism based on contributions to energy storage sharing. Utilizing realistic data from three buildings, our simulations demonstrate that the shared storage mechanism creates a win-win situation for all participants.

Does a shared storage system have a complementarity of power generation and consumption?

In this context, considering the complementarity of power generation and consumption behavior among different prosumers, this paper proposes an energy storage sharing framework towards a community, to analyze the investment behavior for shared storage system at the design phase and energy interaction among participants at the operation phase.
