The capacity-leasing model of shared energy storage (SES) has become a key method for flexibly configuring energy storage, gaining popularity among new energy stations, prosumers, and other stakeholders. However, setting an appropriate price is critical to the development and adoption of SES. Does shared energy storage planning improve the economics of energy storage?

The results show that the proposed shared energy storage planning model significantly improves the economics of energy storage investment and system operation, even under budgetary constraints.

Are shared energy storage lease pricing strategies based on bounded rational behavior?

Aiming at the problems of single pricing and unclear targeted trading mechanism of shared energy storage when providing leasing services for renewable energy stations, this paper proposes a novel lease pricing strategy of shared energy storage based on the bounded rational behavior of renewable energy stations.

Can self-built and leased energy storage be used for shared energy storage?

A novel hybrid mode that integrates self-built and leased energy storage for configuring shared energy storage. A step-cost decrement model is established for the self-built energy storage mode. A two-stage robust optimization model is developed considering supply-demand uncertainty.

How do shared energy storage operators develop pricing strategies?

In the existing literature, shared energy storage operators develop pricing strategies mainly by considering their revenue maximization. Article proposes a two-part price-based shared energy storage leasing mechanism that considers market price and battery degradation to maximize profit.

What is shared Energy Storage (SES)?

As a new paradigm of energy storage industry under the sharing economy, shared energy storage (SES) can effectively improve the comprehensive regulation ability and safety of the new energy power system.

How does leased energy storage reduce the lifecycle cost of SES?

It reduces the investment in leased energy storage to reduce the lifecycle cost of SES. When the robustness of the scheme is at its peak ($\Gamma_s, i = 24$), the power and capacity configuration values of SES are 92.19 kW and 219.56 kWh, respectively.
