

Solution to energy storage problem

Overview

When the sun doesn't shine and the wind doesn't blow, humanity still needs power. Researchers are designing new technologies, from reinvented batteries to compressed air and spinning wheels, to keep energy in reserve for the lean times.

In conclusion, advancing toward a modern and decarbonized energy system requires expanding storage capacities and fostering innovation. While short-term deployment of available technologies is essential, it should not impede the development of promising, long-term solutions.

Finding viable storage solutions will help to shape the overall course of the energy transition in the many countries striving to cut carbon emissions in the coming decades, as well as determine the costs of going renewable — a much-debated issue among experts.

The rise of electric vehicles as an eco-friendly transportation solution also depends on EES to overcome energy storage challenges. The novel aim of this work lies in the elaboration of the large-scale EES for storing and harvesting energy for effective peak-shaving purposes.

Here we conduct an extensive review of literature on the representation of energy storage in capacity expansion modelling.
