

Superconducting magnetic energy storage development frontier

Overview

Superconducting magnetic energy storage (SMES) systems are created by the flow of current in a coil that has been cooled to a temperature below its critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970. A typical SMES system includes three parts: superconducting coil, power conditioning system and energy storage system.

This Special Issue focuses on the latest developments and applications of superconducting magnetic energy storage (SMES), regarding the material improvements, structural optimizations and novel applications.
