Overview

A novel formulation for the battery energy storage (BES) sizing of a microgrid considering the BES service life and capacity degradation is proposed.

A novel formulation for the battery energy storage (BES) sizing of a microgrid considering the BES service life and capacity degradation is proposed.

In order to eliminate the difference of the state of charge (SOC) among parallel battery energy storage systems, an optimization method of power distribution based on available capacity is proposed in this paper. The objective function and constraints are established to realize the optimal power.

Under optimal conditions, a storage battery can store energy based on several pivotal factors. 1. Energy capacity, measured in kilowatt-hours (kWh), defines the maximum energy storage available per unit. 2. Battery chemistry, such as lithium-ion, nickel-metal hydride, or lead-acid, significantly.
