Research on the application of phase change energy storage materials in energy saving building design Abstract: Phase change energy storage materials are a new achievement in the development of modern energy storage professionals, playing an important role in multiple fields such as energy storage.

Phase Change Materials (PCMs) are smart thermal storage materials that absorb or release energy during phase transitions, typically between solid and liquid. These transitions enable passive temperature control across diverse industries. This blog introduces PCM classifications, thermal properties.

Phase Change Materials (PCMs) are substances with a high capacity for thermal energy storage, which absorb or release heat at a specific temperature during the phase change process. PCMs are used in various applications to maintain temperature stability such as in building materials, refrigeration.

Organic phase change materials (PCMs), particularly paraffins and fatty acids, have benefits such as elevated energy density, chemical stability, and non-corrosiveness, rendering them appropriate for HVAC systems, renewable energy integration, electric vehicle battery thermal management, and cold.
