

Thermochemical energy storage and chemical energy storage

Overview

What is thermochemical energy storage (TCES)?

Thermochemical energy storage (TCES) utilizes a reversible chemical reaction and takes the advantages of strong chemical bonds to store energy as chemical potential.

What is thermochemical energy storage?

In this technique, the energy is stored and released in the form of a chemical reaction and is generally classified under the heat storage process. The thermochemical material, used to store thermochemical energy storage, undergoes either a physical reversible process involving two substances or a reversible chemical reaction as given below:

How does thermochemical heat storage work?

Thermochemical heat storage works on the notion that all chemical reactions either absorb or release heat; hence, a reversible process that absorbs heat while running in one way would release heat when running in the other direction. Thermochemical energy storage stores energy by using a high-energy chemical process.

Is thermochemical energy storage reversible?

The thermochemical material, used to store thermochemical energy storage, undergoes either a physical reversible process involving two substances or a reversible chemical reaction as given below: Where Q is the amount of heat required to dissociate A and B.

Is thermochemical storage a good option?

Because low-cost storage materials are often used, thermochemical storage is considered a promising option for medium- and long-term storage, offering the prospect of balancing weekly or seasonal discrepancies between available energy and demand. Theoretically, there are no losses during storage.

What are thermochemical reactions used for thermal energy storage?

Thermochemical reactions like hydration, oxidation, and carbonation have been applied for thermal energy storage, especially for high temperature applications. Thermochemical reactions normally have large energy density and variable heat storage temperature; however, the technology is complex and some used materials are hazardous. 3.1.
