

# Vibration box energy storage

## Overview

---

Does energy storage Supercapacitor box experience resonance?

The supercapacitor box will not experience resonance. The fatigue characteristics within the frequency domain under random vibrations defined by ASDs is analyzed. The maximum fatigue damage of the energy storage supercapacitor box is  $6.24 \times 10^{-6}$ . The number of fatigue cycles is on an order of  $10^5$ .

How energy storage Supercapacitor box is made?

Finally, the energy storage supercapacitor box is manufactured using lightweight aluminum alloy material, and the fatigue damage of the aluminum alloy supercapacitor box is analyzed to provide a basis for the structural design optimization of the energy storage supercapacitor boxes.

What are the fatigue characteristics of energy storage Supercapacitor box?

The fatigue characteristics within the frequency domain under random vibrations defined by ASDs is analyzed. The maximum fatigue damage of the energy storage supercapacitor box is  $6.24 \times 10^{-6}$ . The number of fatigue cycles is on an order of  $10^5$ . Then the energy storage supercapacitor box is manufactured using lightweight aluminum alloy 6063-T5.

Why is random vibration fatigue analysis important for a supercapacitor box?

Therefore, fatigue performance analysis under random vibration is of great significance for the design and life prediction of the supercapacitor box. The methods for structural random vibration fatigue researches primarily consist of two approaches: the time-domain method and the frequency-domain method.

What is vibration energy harvesting?

Vibration energy harvesting makes it easier to integrate IoT devices into several applications by eliminating the requirement for external power

resources and improving data accessibility and connectivity (Tang et al., 2012, Huang et al., 2023, Lee et al., 2024, Uchino, 2017).

What are the 4 vibration modes of a supercapacitor box?

The first 4 typical vibration modes of the supercapacitor box. (a) 1st order; (b) 2nd order; (c) 3rd order; (d) 4th order. The low frequency resonance of the urban rail vehicles refers to the resonant when the rail vehicles are running in the tunnel, which is caused by the air vibration between the train and the tunnel.
