

# Waterproof construction of energy storage project

## Overview

---

A geomembrane is a synthetic, impermeable sheet that controls the movement of liquids and gases in a structure, system, or project. Geomembrane lining systems can be used to waterproof any of the structures that make up pumped storage schemes (PSS). What are the applications of water-based storage systems?

Aside from thermal applications of water-based storages, such systems can also take advantage of its mechanical energy in the form of pumped storage systems which are vastly use for bulk energy storage applications and can be used both as integrated with power grid or standalone and remote communities.

What is the importance of a storage medium for renewable sources?

The development of proper storage medium for renewable sources with high intermittency (such as solar or wind) is an essential steps towards the growth of green energy development and enabling them to compete with fossil fuel resources in the current market.

Why should you combine solar applications with water-based storage?

Coupling solar applications with water-based storages is capable of revolutionizing the process of energy supplement due to their several advantages (high reliability, abundance, high efficiency, environmentally friendliness, etc.).

Why is energy storage important in electrical power engineering?

Various application domains are considered. Energy storage is one of the hot points of research in electrical power engineering as it is essential in power systems. It can improve power system stability, shorten energy generation environmental influence, enhance system efficiency, and also raise renewable energy source penetrations.

Are water-based solar thermal storages suitable for industrial applications?

In a review conducted by Kocak et al. (2020), regarding sensible solar storages for industrial section, it mentioned that the usage of water-based solar thermal storages for low temperature industrial applications such as pasteurization, cleaning and pre-heating processes, lead to considerable declining in fuel cost and CO<sub>2</sub> emissions.

Can a water-based reservoir be used as a poly-generating system?

Many water-based reservoirs have the potential to act as poly-generating systems, serving for more than one application (combined storage tanks for instance). The importance of multi-purpose systems has increased in the recent years and water-based storage systems have high potential to be utilized in such way.
