**Abstract** There has been great interest in developing solid electrolytes (SEs) and all-solid-state batteries (ASSBs) with the aim of enabling highly safe and durable batteries that also might be a key technology to the success of future electronics and electric vehicles (EVs).

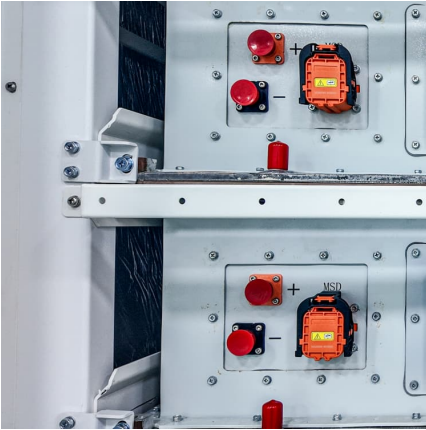

Battery Energy Storage Connectors (or ESS Battery Connectors) are high-current interfaces designed to link battery cells, modules, and systems in residential, commercial, and industrial energy storage setups.

The primary focus of this article centers on exploring the fundamental principles regarding how electrochemical interface reactions are locally coupled with mechanical and transport properties impacting battery performance, giving opportunities to design electrolyte and interface coating materials for advanced solid-state batteries.
