Other well-known mechanical energy storage technologies include flywheels, compressed air energy storage (CAES), and liquid air energy storage (LAES). In PHS, potential energy is stored by pumping water to an up-hill reservoir. Energy is then recovered through a hydropower turbine when the water is.

These include deployment of hybrid energy storage technologies, multi-functional applications of mechanical energy storage systems through appropriate control methodologies and proper sizing strategies for cost effectiveness and increased penetrations of renewable energy sources in the power grid.

According to different forms of energy storage, energy storage can be divided into mechanical energy storage, electrochemical energy storage, electromagnetic energy storage, chemical energy storage, heat storage and

other technical types. Each type of energy storage has its own characteristics, and.
