What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

What type of batteries are used in energy storage systems?

Lithium-ion batteries are the most widely used type of batteries in energy storage systems due to their decreasing cost over the years. As of 2024, the average cost for lithium-ion batteries has dropped significantly to R2,500 per kilowatt-hour (kWh), making energy storage systems more financially viable and accessible for businesses.

Where is energy storage used?

Energy storage can be found in various locations, from small batteries in electronic devices to large-scale installations in power plants or ES facilities. ES is also used in electric vehicles, homes, and other locations where energy must be stored and used when needed.

Why do we need energy storage systems?

As a consequence, the electrical grid sees much higher power variability than

in the past, challenging its frequency and voltage regulation. Energy storage systems will be fundamental for ensuring the energy supply and the voltage power quality to customers.
