Phlegm can exist in different colors. The color could provide important clues about a person's health.

- Yellow or green: Indicates an infection often by a virus or bacteria.

Phlegm and humourism is an ancient theory that the human body is filled with four basic substances, called the four humours, which are held in balance.

Lungs: Mucus in the lungs is also known as sputum or phlegm. Sinuses: Mucus formed in the sinus drains out through the nasal passages. Mouth: Mucus in the mouth acts as a lubricant and serves as a line of defense. Throat: Mucus in the throat is also known as phlegm or sputum.

Lungs: Mucus in the lungs is also known as sputum or phlegm. Sinuses: Mucus formed in the sinus drains out through the nasal passages. Mouth: Mucus in the mouth acts as a lubricant and serves as a line of defense. Throat: Mucus in the throat is also known as phlegm or sputum.

Phlegm (/ 'flɛm /; Ancient Greek: φλέγμα, phlégma, "inflammation", " humour caused by heat") is mucus produced by the respiratory system, excluding that produced by the throat nasal passages. It often refers to respiratory mucus expelled by coughing, otherwise known as sputum. Phlegm, and mucus as.

Mucus is essential for the functioning of many of the body's organs. A person might think their body only makes mucus in response to illness, allergens, or irritants. However, the body is always producing mucus, which is crucial for the functioning of several organs and the immune system. Many.

It's also called phlegm, snot or sputum. Mucus is usually thin and clear. Certain colors might mean you have an infection, but it can't diagnose specific illnesses. What is mucus?

Mucus is a slippery fluid that lines your respiratory, digestive, urinary and reproductive tracts. It acts like a.

The lungs do not have a specific capacity for storing phlegm, as phlegm is a mucus secretion produced by the respiratory system to trap and eliminate pathogens, irritants, and foreign particles. However, excessive phlegm can indicate underlying health issues. 1. Phlegm serves as a protective.

It consists of several organs including nostrils, mouth, pharynx, larynx, nasal cavity, and lungs. All throughout the respiratory system you will find a mucous membrane. The purpose of mucus throughout the respiratory system is to trap particles which are inhaled and keep them from circulating.

Phlegm is a form of respiratory mucus produced by the lungs. The airways between the larynx and the respiratory bronchioles are lined by columnar epithelium over which an airway surface liquid (ASL) lies. This layer is between 5 and 100 μm thick.
